ABSTRACT

A Petersen-grab was used to sample bivalves and gastropods in the mouth of Pepetan River, Rawameneng. Four replicate samples were made at each of the 3 stations sampled from September to October 1998. Six species of bivalves and 14 species of gastropods belonging to 18 families were found. Emphasis was on the distribution of *Anadara granosa*. The highest density was found in silty clay loam (113 ind. m⁻²) and the lowest in clay (2 ind. m⁻²). Water characteristics during sampling were temperature 27-31 °C, salinity 15-34 ‰, turbidity 6-200 NTU, and dissolved oxygen 2.8-7.2 ppm.
