

Sex determination and sexual organ systems of the babylon snail *Babylonia spirata* Linné

Fredinan Yulianda

Yulianda, F. 2001. Sex determination and sexual organ systems of the babylon snail *Babylonia spirata* Linné. - Phuket Marine Biological Center Special Publication 25(1): 131-133.

Babylonia spirata has separate sexes. Hermaphroditic snails have not been encountered. Male and female can be distinguished from a shell length of 20 mm. The main sexual components of the male and female reproductive systems are described. A small, pointed, cylinder-shaped, light to dark brown penis located above right tentacle characterises males.
