ABSTRACT

Collections of marine shelled gastropod molluscs were made from Phuket Island, the adjacent mainland and offshore islands during 1971 and 1972, and 1974 to 1976. In total 382 species were identified. The majority of the identifications have been confirmed by authoritative specialists. A systematic checklist is provided here, with brief ecological notes on the habitat (s) from which each species was collected. 259 of the species are illustrated.
