**ABSTRACT:** This report reveals impressions and observations about sampling *Idiosepius pygmaeus* in a selected mangrove area. *Idiosepius pygmaeus* is shown to inhabit the whole tidal range of a small tributary of the Bangrong River, Phuket Island, Thailand. Males are predominantly located in the upper and lower reaches of the tributary. Females are observed in the lower part and at the mouth of the tributary sometimes, mating with-males. Bank vegetation has a greater influence on the presence of specimens, than current speed or sudden weather changes.
